iNetVu™ NAVIGATOR

What is iNetVu™ Navigator?

iNetVu™ Navigator is a software-based travel planning system designed for people on the move!
It is integrated with theMicrosoft® MapPoint® 2002 software application.
It uses the iNetVu mobile system's built-in Global Positioning System(GPS) and requires no additional hardware or wiring.
It provides you with the ability to track and display your preciselocation on its map - even if the iNetVu dish is in use for during an Internet session.
It even works when the dish is stowed and you're moving along the highway!

Because iNetVu Navigator can show you any instant where you are, planning a stop for fuel, food or even a local attraction becomes easy!

The Toolbar

At the heart of iNetVu™ Navigator's integration with Microsoft's®
MapPoint® application is its simple-to-use toolbar.

Use iNetVu Navigator's easy access toolbar to:

✓ **Locate nearby places and locations of interest** (gas stations, restaurants, etc.) within a predetermined radius. As you travel along your route, these locations will be flagged on your computer screen as they "enter" your chosen search radius.

✓ **Get accurate, easy-to-follow directions**, that start from wherever you happen to be at that time. And, because MapPoint is aware of one-way systems and other restrictions, it'll plan a route appropriately.

✓ **Keep a trip log**. When enabled, Navigator will track everywhere you've been, right up to your current location.

✓ **Find out what destinations are possible to reach within a specific time frame**. Suppose you're on the road in an unfamiliar town and you're ready to eat dinner. You decide you want steak and seafood and want to find out how many steak or seafood restaurants are within a 10 minute drive from your current location. Obtaining this information is a snap! With a few mouse clicks, you'll be given the restaurant names, directions to get to them and even their telephone numbers.

... and so much more!
